1 EXECUTIVE SUMMARY

Central Bedfordshire Council is a major investor of public resources and as such, should ensure that new developments make a positive contribution to the local economy and society.

Any new proposal should always answer these two basic questions:

- What are the specific outcomes sought?
- Will these outcomes deliver a positive benefit to the local economy and society?

Cost Benefit Analysis (CBA) is a decision-making tool that helps provide assurance around these questions by quantifying all costs and benefits in monetary terms.

Central Bedfordshire Council's Highways Team has been working on just such a new development and this Cost Benefit Analysis supports its introduction by demonstrating the positive financial outcome delivering its objectives will provide.

Minimising congestion is a key transport challenge for any Council and especially for a busy authority like Central Bedfordshire.

The ability of people and goods to move freely around the authority, meeting the needs of business, accessing essential services and for social and leisure purposes depends largely on the road network operating effectively.

The proposed Central Bedfordshire Permit Scheme tackles head-on one of the major causes of congestion, road and street works, in a robust and positive way and is a major opportunity to positively reduce congestion and the disruption it causes on the road network.

The proposed Central Bedfordshire Permit Scheme is designed to deliver effective co-ordination and management of essential road works by introducing a new Permit Authority in Central Bedfordshire.

The new Permit Authority is not intended to prevent activities necessary for the maintenance or improvement of the road network or the services running underneath it. It is designed to make available the necessary resources to achieve an appropriate balance between the interests of the various parties and where possible, bring about effective co-ordination between all the different competing interests.

Summary findings of the Central Bedfordshire Permit Scheme Cost Benefit Analysis

Values based on 25 Year Operation of the proposed Scheme (2010 prices)

| | |
|--|--------------|
| Value of benefits to economy and society | £107,888,294 |
| Set-up and operating costs | £10,338,728 |
| Financial benefit to the local economy from introducing the Scheme | £97,549,567 |
| Benefit to Cost Ratio | 10.44 |

2 INTRODUCTION

2.1 Permit Scheme Objectives

Swift Argent Ltd was commissioned by Central Bedfordshire Council (CBC) in 2014 to develop a road works Permit Scheme known as the Central Bedfordshire Permit Scheme (CBPS), part of which includes the development of a detailed Cost Benefit Analysis.

The principal objective of the Central Bedfordshire Permit Scheme is to improve the strategic and operational management of the highway network through better planning, scheduling and management of activities to minimise disruption to road users.

The Central Bedfordshire Permit Scheme will enable better co-ordination of activities throughout the highway network, ensuring those competing for space or time in the street, including traffic, to be resolved in a positive and constructive way.

The objectives and benefits of the Central Bedfordshire Permit Scheme are:

- Reduced congestion on the road network
- Improvements to overall network management
- A reduction in delays to the travelling public
- A reduction in costs to businesses caused by delays
- Promotion of a safer environment
- Reduced carbon emissions

2.2 Scope of work

The development of a detailed Cost Benefit Analysis is a requirement of the formal application to the Secretary of State for a Permit Scheme.

The analysis assesses the impact of Permits over the full range of required social and economic variables that have been specifically agreed in consultation with the UK Department for Transport (DfT).

An effective Cost Benefit Analysis is a mechanism to assess the benefits and costs of an investment both in terms of its overall viability and in relation to other options.

In this analysis, all benefits and costs are quantified in monetary terms and discounted over the length of the proposal to allow comparison on a common basis.

The output of the Cost Benefit Analysis is the presentation of a Benefit to Cost Ratio (BCR) which presents a scale of the Scheme benefits over costs and a Net Present Value (NPV) that is the sum total of the discounted benefits and costs.

This report will identify the additional costs of operating the Scheme, which are to be met by the Permit fees charged to Utility companies and from the Central Bedfordshire Council existing budget, against the value of the benefits it will deliver to the wider area of Central Bedfordshire.

It will identify the data used and the methodology undertaken to prepare the Cost Benefit Analysis and present the statutory outputs including the BCR and NPV of the Scheme.

2.3 Report Structure

After this introduction, the report is set out as follows:

- Section 3 Analysis and Context;
- Section 4 Input Data;
- Section 5 Delay Modelling;

- Section 6 Permit Scheme Operation;
- Section 7 Financial Calculations;
- Section 8 Statutory Outputs; and
- Section 9 Central Bedfordshire Permit Scheme Cost Benefit Analysis Results

3 ANALYSIS AND CONTEXT

3.1 Introduction

This section presents the legislative and research context for the Central Bedfordshire Permit Scheme Cost Benefit Analysis.

3.2 Legislative context

The legislative guidance used for this study is contained within:

- Traffic Management Act 2004, Permit Schemes, Decision-making and development (2nd Edition), November 2010;
- Traffic Management Act 2004, Code of Practice for Permits, March 2006; and
- WebTAG guidance Values of Time and Operating Costs (TAG Unit 3.5.6 October 2013).
- Department of Transport's (DfT) Halcrow study "Assessing the Extent of Streetworks and Monitoring Effectiveness of Section 74 in Reducing Disruption Volume 3 – Estimation of Cost of the Delay from Utilities' Street Works, June 2004"
- Chapter 8 of the Traffic Signs Manual DfT 2009
- Design Manual for Roads and Bridges Volume 14 Economic Assessment of Road Maintenance

3.3 Traffic Management Act 2004

The Traffic Management Act 2004 (TMA 2004) establishes the guidelines for street works. It has been in operation since April 2008 throughout the United Kingdom. The second edition states that any parties wishing to work on a road will require a Permit from the Highway Authority, who in turn will have additional powers to refuse or specify conditions associated with Permit permission for the overall efficiency of the operation of the road network.

3.4 WebTAG

WebTAG was first issued by the UK Department for Transport in 2003. It is based upon the 'New Approach to Appraisal' developed in the late 1990s and is an internet based multimodal guidance on appraising transport projects. WebTAG was recently updated in October 2013 including changes in value of time and operating costs, accident costs, carbon emissions and traffic growth forecasts as described in Road Transport Forecasts 2013.

3.5 Research

The benchmark study for Permit Scheme appraisal was produced by the Halcrow Consultancy at the time of the TMA in 2004.

3.6 Halcrow Study

In July 2004, Halcrow produced a report for the DfT on the impact of road works. The results (Table 1) estimate an overall cost of disruption caused by Utility works in England in 2002/03 at £4.36 billion.

Table 1 Halcrow study results summary

| Impact of Roadworks | Electric | Gas | Telco | Water | Total |
|---------------------------------------|----------|-------|-------|-------|--------|
| Number of Roadworks (000s) | 234 | 223 | 244 | 499 | 1200 |
| Average cost (£000) per Roadworks | £5.30 | £5.40 | £2.20 | £2.80 | £15.70 |
| Annual Roadwork Disruption cost (£bn) | £1.24 | £1.20 | £0.54 | £1.40 | £4.38 |

Source: Halcrow Group, quoted in DfT draft Permit Schemes Regulatory Impact Assessment (RIA), July 2007

3.7 Implications for Central Bedfordshire Permit Scheme

Using the DfT sanctioned report, it is possible to get an idea for the likely implication of the Central Bedfordshire Permit Scheme either using a 'top down' approach from the overall saving or a 'bottom up' calculation based upon the implied rate per road works.

From a top down perspective, with an estimated 0.62% of utility road works occurring in Central Bedfordshire and a 5% reduction in road works associated with the Permit Scheme, it may be expected to produce annual savings of £1.34m in 2002 prices, (£2.24 million in 2010 prices). (Table 2)

Table 2 Forecast Benefits – Top Down approach

| Halcrow Study | £ |
|--|---------------|
| Annual UK cost of roadworks (£bn) | 4.36 |
| Proportion of roadworks in Central Bedfordshire | 0.62% |
| Annual Central Bedfordshire cost of roadworks (£m) | 26.83 |
| Roadwork Reduction from Permit Scheme | 5% |
| Estimated Permit Scheme saving (2002 prices) (£m) | £ 1.34 |
| Estimated Permit Scheme saving (2010 prices) (£m) | £ 2.24 |

However, working up from the actual number of Noticed Works in Central Bedfordshire and using the 'rule of thumb' estimate from the DfT report of £600 per works per day and an average 6 days, the projected annual savings would be £1.33m in 2002 prices (£2.22 million in 2010 prices). (Table 3)

Table 3 Forecast Benefits – Bottom up approach

| Annual Number of Utility Works | Total |
|---|---------------|
| Pre-scheme Number of Utility Works | 7,385 |
| Utility Works after 5% reduction | 7,016 |
| Total Utility Permit reduction | 369 |
| Average Days Duration from Halcrow Study | 6 |
| Number of road work days saved | 2,216 |
| Total Cost at £600 per works per day (£ m) (2002 prices) | £ 1.33 |
| Total Cost at £600 per works per day (£ m) (2010 prices) | £ 2.22 |

The figures above give an estimate of the upper and lower expectations from the Central Bedfordshire Permit Scheme of between £2.22m and £2.24m in 2010 prices. As the two methods are within 5% this is

considered a reliable estimate. Both methods do have a degree of uncertainty as they are based on sample national data which may not be a correct representation at a local level.

4 INPUT DATA

4.1 Introduction

This section outlines the information sources and assumptions used in the Central Bedfordshire Permit Scheme Cost Benefit Analysis. The Cost Benefit Analysis has been prepared with 2010 as the price base year for presentation values as set out in WebTAG.

4.2 Cost Benefit Assumption

The objective of the Central Bedfordshire Permit Scheme is a reduction in the disruption caused by road works through improved control and co-ordination.

The central assumption of the analysis is that the introduction of the Permit Scheme will cause a 5% fall in Permit applications, and have a commensurate effect on roadwork activity and all associated aspects of the analysis. This 5% reduction is known as the Permit Scheme reduction factor.

Table 4 Central Assumptions

| CBA modelled variable | Rate |
|---|------|
| Permit Scheme Reduction Factor | 5% |
| Target year for reduction in works | 1 |
| Ratio of Utility permits to overall permits | 50% |

The analysis worked on the operating assumption that the effects of the Permit Scheme will start on Scheme opening with reductions occurring after operational lead-time in the second month. The breakdown of annual Permit numbers are presented in Table 5 below.

Table 5 Annual Permit Summary

| Annual Permits | Total |
|--------------------------------------|-------|
| Pre-scheme Number of Utility Permits | 7,385 |
| Utility Permits after 5% reduction | 7,016 |

4.3 Data sources

The Cost Benefit Analysis has been produced from four sources of information:

- Government guidance;
- A completed Permit Fees Matrix in a format provided by the DfT;
- Local data provided by Central Bedfordshire Council; and
- DfT Traffic Flow Data

Standard Cost Benefit Analysis assumptions and sensitivity factors have been used in line with recommendations in DfT's Annex C of TMA 2004 Decision-making and development (2nd edition).

The Local data provided by Central Bedfordshire Council contained both the number of permits by type and specific information on Scheme operation and costs.

4.4 Discount and Risk Factors

The study uses the DfT recommended discount rate for assessment periods under 30 years of 3.5%.

The risk factors are applied to capital expenditure costs and are taken from standard values in Annex C of TMA 2004 Decision-making and development (2nd Edition) and shown in 6.

Table 6 Discount and Risk Factors

| CBA modelled variable | Rate |
|------------------------------------|------|
| Discount Rate | 3.5% |
| Risk Bias Factor | 20% |
| Optimism Bias Factor | 15% |
| Combined Risk-Optimism Bias Factor | 38% |

4.5 Model Variable specification

This section identifies the treatment of costs in the period after Scheme implementation. All values used are standard values taken from Annex C of TMA 2004 Decision-making and development (2nd edition) and shown in Table 7.

Table 7 Model Variable specification

| CBA modelled variable | Rate |
|---|------|
| Cost reduction based on permit reduction | 50% |
| Reliability benefit factor | 20% |
| Allowance for Phased Works | 20% |
| Proportion of Annually recurring set up costs | 0% |

The introduction of the Permit Scheme will bring about a reduction in Permit applications, which in turn will mean lower Scheme costs. The TMA 2004 suggested 50% proportion used means that the reduction in Permit numbers of 5% will produce a 2.5% reduction in Scheme costs.

The reliability benefit factor is an approved standard uplift to the time benefit attributed to the reduction of road works. The allowance for phased works is a factor applied to the number of Permits applications to get a total number of Permits upon which the calculations are based.

No costs associated with the establishment of the Permit Scheme are projected to extend beyond the Scheme opening.

4.6 Statutory information associated with Permit Schemes

This study uses the guidance outlined in the TMA 2004 at the time of the study. The maximum charge per Permit type is shown in Table 8 below.

Table 8 Statutory Permit Fee rates

| Revised maximum fee structure for each category of works and for a hierarchy of main and minor roads - Road category refers to the reinstatement category of the street under the New Roads and Street Works Act 1991 | | |
|---|--|---|
| Work Type | Road Category 0-2 or Traffic-sensitive | Road Category 3-4 and non traffic-sensitive |
| Provisional Advance | £105 | £75 |

Central Bedfordshire Permit Scheme Cost Benefit Analysis

| | | |
|---|------|------|
| Major works – over 10 days <u>and</u> all major works requiring a traffic regulation order. | £240 | £150 |
| Major works – 4 to 10 days | £130 | £75 |
| Major works – up to 3 days | £65 | £45 |
| Activity Standard | £130 | £75 |
| Activity Minor | £65 | £45 |
| Immediate Activity | £60 | £40 |
| Permit Variation | £45 | £35 |

4.7 Central Bedfordshire Council data

Central Bedfordshire Council supplied the following data and policy decisions:

- Policy data; and
- Road works Data.

4.8 Policy data

The policy decisions related to Permit Scheme operation outlined in Table 9 were obtained from Central Bedfordshire Council.

Table 9 Operational Variables

| CBA modelled variable | Period |
|---|--------|
| Number of months to establish Permit Scheme | 1 |
| Number of months to implement Permit Scheme | 1 |
| Recovery period for set-up costs (Years) | 3 |
| Debtor days | 30 |

4.9 Road works Data

Central Bedfordshire Council provided the information on the number of road works and shown on Table 10 below.

Table 10 Roadwork Totals

| Central Bedfordshire Notice Volumes | | | | | | |
|-------------------------------------|--------|-----|--------|-----|--------------|-----|
| Work Type | RC 0-2 | | RC 3-4 | | Total Volume | |
| | Number | % | Number | % | Number | % |
| Major | 34 | 2% | 152 | 3% | 186 | 3% |
| Standard | 277 | 15% | 964 | 17% | 1,241 | 17% |
| Minor with Exc | 984 | 55% | 2,891 | 52% | 3,875 | 52% |
| Minor without Exc | 58 | 3% | 53 | 1% | 111 | 2% |
| Urgent | 331 | 18% | 1,231 | 22% | 1,562 | 21% |
| Special Urgent | - | 0% | - | 0% | - | 0% |
| Emergency | 108 | 6% | 302 | 5% | 410 | 6% |
| Totals | 1,792 | 24% | 5,593 | 76% | 7,385 | |

The table expresses work type by two types; RC 0-2 Traffic Sensitive Streets and RC 3-4 Non Traffic Sensitive Streets. RC is an abbreviation of Reinstatement Category which is a function of Commercial Vehicles (CV) traffic volumes.

4.10 DfT data

The following data was obtained from the Halcrow Study, traffic management requirements and published traffic count data:

4.11 Works Data

The Halcrow Study found that the average size of carriageway works is 2 metres width by 20 metres length. Data was collected from 25 authorities across the whole of England on permit notices and the percentages of notices by reinstatement category and excavation length is summarised on Table 11 below. This shows that there is a very high proportion of works on minor roads RC 3-4.

Table 11 Percentage of Notices by Reinstatement Category and Excavation Length

| DfT Study Table 2 - Percentages of Notices by RC and Excavation Length Vol 3: Extents of Works and Monitoring Disruption | | | | | | |
|---|----------------|-------|------|------|------|------|
| RC | | 10m | 30m | 50m | 100m | 200m |
| RC 0-2 | % of all works | 16.3% | 0.1% | 1.0% | 0.8% | 1.0% |
| | % of RC 0-2 | 85% | 1% | 5% | 4% | 5% |
| RC 3-4 | % of all works | 70.0% | 4.2% | 2.6% | 2.1% | 1.7% |
| | % of RC 3-4 | 87% | 5% | 3% | 3% | 2% |

The study also reported the average duration by work type and utility. The average for each utility was proportioned by the number of notices to derive an average duration by work type and is summarised in Table 12 below. It was noted that there was a high percentage of water utility works.

Table 12 Average duration by work type by utility

| DfT Study Average duration by work type by utility | | | | | |
|--|------|-----|---------|-------|----------------------------|
| Work Type | Elec | Gas | Telecom | Water | Avg Duration All Utilities |
| Major | 41 | 40 | 23 | 30 | 33 |
| Standard | 7 | 7 | 9 | 15 | 9 |
| Minor with Exc | 3 | 4 | 2 | 2 | 2 |
| Minor without Exc | 3 | 4 | 6 | 2 | 3 |
| Urgent | 6 | 5 | 3 | 3 | 4 |
| Special | 3 | 3 | 3 | 2 | 2 |
| Emergency | 6 | 7 | 2 | 3 | 7 |

Works require traffic management to keep workers safe and the requirements are detailed in Chapter 8 of the Traffic Signs Manual DfT 2009 and is summarised in Table 13 below for different road types.

Table 13 Traffic Management for Street works

| Traffic Management for Street works Traffic Signs Manual Chapter 8 | | | | | | | |
|--|--------------------------|------------------|--------------------------|------------------------|-------------------------|-------------|-----------------------|
| Road Type | Single 30mph or less (m) | Single 40mph (m) | Single 50mph or more (m) | Dual 40mph or less (m) | Dual 50mph or 60mph (m) | Dual NS (m) | Dual NS Congested (m) |
| Taper | 50 | 80 | 100 | 100 | 150 | 200 | 200 |
| Approach signs | 45 | 110 | 450 | 300 | 800 | 1609 | 3218 |
| Min vis to sign | 60 | 60 | 75 | 60 | 75 | 120 | 120 |
| End of works sign from end | 30 | 45 | 45 | 45 | 90 | 90 | 90 |
| Totals excl works | 185 | 295 | 670 | 505 | 1115 | 2019 | 3628 |

The Halcrow study reported the daily cost of street works by road type and excavation length and is summarised in Tables 14 and 15 below.

Table 14 Daily Cost of Rural Works

| DfT Study Table 4 | | | | | |
|--|--------------|-------|-------|--------|--------|
| Daily Cost of Rural Works (£) by Reinstatement Category and Length | | | | | |
| Reinstatement Category | Typical AADT | 10m | 50m | 100m | 200m |
| 0 | <32,000 | 2,500 | 3,000 | 3,300 | 4,000 |
| 1 | 16000 | 7,850 | 9,050 | 10,250 | 11,000 |

| 4 | 6000 | 200 | 280 | 375 | 550 |

4.12 Traffic Data

Traffic data was obtained from the DfT who monitor annual traffic flows for all authorities in the UK, For Central Bedfordshire there are 67 site locations on 'A' principal roads and minor roads for Annual Average Daily Flow (AADF) classified by vehicle type.

The latest data for 2013 is shown on Tables 16 to 21 below and location plan shown on Figure 1.

The RC has been derived from the typical AADT flows as shown in Table 14 and 15.

Table 16 DfT Traffic Flow Site Data 2013 (Sheet 1 of 6)

Figure 1 DfT AADT Locations Central Bedfordshire

5 DELAY MODELLING

5.1 Delay Modelling Methodology

The estimation of delay is detailed in the Halcrow study. Two methods of measurement are listed

- (a) live site measured method; and
- (b) modelling techniques to replicate works on the ground.

The measured method is described as a restricted illustrative example of the impact at works and a general model is more industry recognised as the more robust technique that can be audited and validated.

There are three types of modelling software that can be used to model delay at works namely;

QUADRO – models queues and delays at road works;

SATURN – macro assignment;

and VISSIM – micro simulation.

The Halcrow study stated in Section 2.1 that on evaluation there were inconsistencies with the latter two types and that QUADRO would give the most consistent results although it is suited more to rural locations with little diversion routes but it is able to model the additional delay on diversion routes when the maximum queuing delay on the main route is exceeded.

QUADRO is able to appraise individual works that are planned in the future on different types of road by modelling the delay experienced by road users, quantify the delay and estimate the cost of the delay.

The software is able to calculate and convert delays in to monetary figures as detailed in WebTAG Unit 3.5.6. with assumptions in regard to valuation of time, operating costs and accidents.

Users are required to input base link specific details including network classification, traffic flows, road type characteristics and any diversion routes. Works details including site length, works type such as lane closures and shuttle working. The latest version released in January 2014 Version 4 release 12 will be used for the Cost Benefit Analysis. The QUADRO Manual is included in the Design Manual for Roads and Bridges Volume 14 Economic Assessment of Road Maintenance DfT 2002.

5.2 The valuation of costs in quadro

5.2.1 The Valuation of Time

QUADRO calculates the delays at works and translates these into monetary figures using standard values of time.

The latest values are provided in WebTAG Unit 3.5.6 and is shown in Table 22 and 23 below. QUADRO converts the resource cost to market price to be consistent with the Economic Efficiency of the Transport System (TEE) table. The market price is calculated by multiplying the resource value by $(1 + t)$ where t is the average rate of indirect taxation in the economy.

5.2.2 The Valuation of Vehicle Operating Costs

QUADRO calculates the vehicle operating costs (VOC) incurred by traffic with and without works.

VOC may increase during works if speeds are reduced or a long diversion route. The effects of temporary blockages caused by accidents are solely assessed on journey time and operating costs are not calculated. As the resource cost of fuel, fuel efficiency and fleet composition change independently, the relationship of resource cost (per kilometre) to market prices changes annually.

The programme is informed of changes in tax rates over time and are shown in Tables 24, 25 and 26 below.

Values for 2010 VOC are shown in Table 27 below.

Carbon emissions are considered in terms of the change in the equivalent tonnes of carbon Table 28 and estimated from fuel consumption Table 29 below.

5.2.3 The Valuation of Accidents

Additional accidents may be expected in works and there are two types of cost incurred the cost of delay and the direct cost.

The direct cost includes the casualty, damage to property, insurance administration, police time and an allowance to damage only accidents. QUADRO calculates these values on the network using DfT standard values for average personal injury accidents on various types of road.

Values of most elements are proportional to national income and for 2010 are shown in Table 30 and 31 below. Accident values increase in line with GDP as shown in Table 32 below. Accident rates are calculated with and without works, combined link and junction rates are used in QUADRO,

Table 33 shows accident rates for 15 road types without works and Table 34 shows accident rates for each type and traffic management layout. Local data can be used only if available for both the without and with works in this Cost Benefit Analysis these default values are used.

Table 35 shows the number of casualties per accident.

Table 30 WebTAG – Cost per Casualty

| Cost per Casualty | |
|-------------------|-----------|
| Severity | Cost £ |
| Fatal | 1,645,822 |
| Serious | 184,944 |
| Slight | 14,257 |

5.3 DELAY MODELLING IN QUADRO

5.3.1 Elements of Delay

The delay at works are made up of a number of elements that include the reduce running speeds through the site, traffic signal control for shuttle working, insufficient capacity causing queuing and diversion and are calculated by the General Delay Sub-Model.

Accidents and breakdowns can cause further delay and will depend on location, amount of width and time of day and if alternative routes are available and are calculated by the Incident Delay Sub-Model.

5.3.2 The General Delay Sub-Model

This model is run in each direction and for the four day types Monday to Thursday, Friday, Saturday and Sunday for each hour, the remaining queue is added to the following hour.

The assumption is that regular drivers would travel on the route that minimises the journey time. A driver may minimise journey time by diverting to an alternative before the work site and re-join past the site or divert the route completely.

If traffic is not expected to divert at a particular site and instead queue this implies there are unattractive routes. It can be found that a specification of a diversion route can be particularly difficult and QUADRO is able to be run with a maximum queuing delay.

For the purpose of the Cost Benefit Analysis this has been used, sample run data is included in the QUADRO manual for different types of road for maximum queuing delay and shown on Table 36 below. Once the maximum queue time is exceeded drivers will divert to a route and assumed that this would equal the journey time through the work site.

Table 36 Max-Q-Delay

| Typical Max-Q-Delay QUADRO | |
|----------------------------|--------------------|
| Type of Road | Max-Q-Delay (mins) |
| S2 | 5 |
| WS2 | 5 |
| D2AP | 10 |
| D3AP | 15 |

5.3.3 The Incident Delay Sub-Model

If a breakdown or accident occurs within the site length this will restrict the capacity further.

Unlike the General Model drivers will not divert as this would not be a common event. This model is not run for shuttle working sites as it is assumed that the obstruction would be speedily removed.

This sub model is run twice once for breakdown and once for accidents. The sub model assumes that breakdowns occur at a rate shown in Table 37 below. Accident Rates were tabled earlier in Section 4.2.

Table 37 Breakdown Rates

| Default Breakdown Rates QUADRO | |
|--------------------------------|------------------------|
| Vehicle Type | Rate (vkm) |
| Light | 10 per 10 ⁶ |
| Heavy | 5 per 10 ⁶ |

5.4 TRAFFIC input

5.4.1 Network and Route Type Description

For each of the work sites certain characteristics are required by QUADRO including the length of the works site, adjoining sections up and downstream of the site (both directions) and the diversion route.

For the purpose of this Cost Benefit Analysis the diversion length is not modelled as the maximum queue delay method has been used.

Central Bedfordshire Permit Scheme Cost Benefit Analysis

The main route is considered to be consistent along its length and no flow variations. A road class is specified as shown on Table 38 below to calculate a speed/flow relationship with default values shown on Table 39 and 40.

For each road class the user is able to input geometric parameters such as road width, hilliness, accesses along route, visibility, for the purpose of this Cost Benefit Analysis, typical values have been applied as set out in Table 41 below. The work site type is defined by the number of lanes open or shuttle working as shown on Table 42 below that selects a default capacity.

QUADRO contains values for average duration of incidents and are shown on Table 43 below.

Table 38 Road Classes

| QUADRO Road Classes | |
|---------------------|---|
| Road Class | Description |
| Class 1 | Rural single carriageway |
| Class 2 | Rural all-purpose dual 2 lane carriageway |
| Class 3 | Rural all-purpose dual 3 or more lane carriageway |
| Class 4 | Motorway (urban or rural), dual 2 lanes |
| Class 5 | Motorway (urban or rural), dual 4 or more lanes |
| Class 6 | Motorway (urban or rural), dual 3 lanes |
| Class 7 | Urban road, Central, single or dual carriageway |
| Class 8 | Urban road, Non-central, single or dual carriageway |
| Class 9 | Small town road, single or dual carriageway |
| Class 10 | Suburban Main Road, single carriageway |
| Class 11 | Suburban Main Road, dual carriageway |

Table 39 Minimum Speeds

| Default minimum speeds QUADRO | |
|-------------------------------|------------------------|
| Road Class | Minimum speed (kph) |
| Classes 1 to 6 | 45 |
| Class 7 | 25 |
| Class 8 | 15 |
| Class 9 | 30 |
| Class 10 | 25 |
| Class 11 | 35 |

Central Bedfordshire Permit Scheme Cost Benefit Analysis

Table 42 Work Types

| QUADRO Work Types | |
|-------------------|--|
| Works Type | Description |
| 0 | No lanes open in this direction |
| 1 | One lane open in this direction |
| 2 | Two lanes open in this direction |
| 3 | Three lanes open in this direction |
| 4 | Four lanes open in this direction |
| 5 | Five lanes open in this direction |
| 9 | Shuttle working |
| add 10 | if layout features contra-flow working |

Table 43 Incident Duration

| Default Breakdown and Accident Durations in QUADRO | | |
|--|---------------------------|--------------------------|
| Type of Road | Breakdown Duration (mins) | Accident Duration (mins) |
| Motorway | 25 | 30 |
| Single and Dual AP | 40 | 45 |

5.4.2 Variation in Traffic Flow

Traffic flows vary by hour, day, week and month and different type of vehicles.

QUADRO calculates user costs daily and normally for a 7 day week using the four day types. For the purpose of this Cost Benefit Analysis AADT flows have been used and QUADRO converts this to Annual Average Hourly Traffic (AAHT) to generate an hourly flow profile.

The QUADRO model uses directional flow as each direction is modelled separately.

Two-way input flows are split by tidal behaviour for example the direction into town in the morning peak and the direction is specified by the user.

5.4.3 Vehicles in Work Time and Vehicle Occupancies

QUADRO considers the disaggregation of time spent in work and non-work mode for each vehicle type.

The National Travel Survey (NTS) showed the average car mileage in work mode, commuting mode and non-working mode and are further disaggregated by average hourly percentages.

Averages for weekdays and weekends, vehicles and journey types are shown on Table 44 below.

Table 44 WebTAG – Trip Proportions

| Table A 1.3.4: Proportion of travel in work and non-work time | | | | | | | | | Proportion of trips made in work and non-work time | | | | | | |

5.5 Site specific quadro input data

5.5.1 Sample Site Data

The 67 sites shown on Tables 16 and 21 showed a good spread of data over the Central Bedfordshire network.

For each site, data files were created and works were run for the site lengths carried out with the Halcrow Study 10, 30, 50, 100 and 200 metres.

In total 335 outputs were created and are provided in Appendix A. The Daily Cost of all sites was averaged for Rural and Urban roads by RC and excavation length and is shown on Table 45 and 46 below.

The number of samples used for the Cost Benefit Analysis is required to be proportioned to the actual number of works and statistically confident in the data.

The number of samples used for each work type are shown on Table 47 below with the percentages matching the proportions of actual works shown in Table 10. This has been statistically verified at a 95% confidence level with a confidence interval of 5%. A confidence interval within +/- 5% is considered to be reliable.

The samples used for the Cost Benefit Analysis were selected by ranking the 67 sites by impact and making the average cost of sites selected equal the mean. The sample sites were also proportioned by excavation length so that the percentages match the Halcrow study and are shown on Table 46 below.

The sample sites average duration for each work type was matched to the Halcrow Study as shown in Table 11. For example, for Major Works the average duration was 33 days, duration were run between 41 and 23 days and compares to values in the Halcrow Study. High and Low cost forecasts were derived, for High the highest duration of days was applied to the highest ranking site by impact, for Low the highest duration of days was applied to the lowest ranking site by impact. The average of the two forecasts was used to obtain the Total Delay of Works. Summarised impacts are provided in Appendix B.

Table 45 Central Bedfordshire Delay Modelling Daily Cost of Rural Works

| Central Bedfordshire | | | | | | | |

5.6 Monetized Costs and Benefits

The socio-economic benefits derived from a 5% and 10% Permit Scheme reduction are shown for the opening year in summary on Table 49.

Central Bedfordshire Permit Scheme Cost Benefit Analysis

The statutory guidance on reliability benefits achieved from a reduction in the variability in travel times for road users is provided by WebTAG Unit 3.5.7, which recommends a mark-up on travel time-savings for urban roads of between 10% to 20%.

Recent research from Transport for London (TfL) GPS data for inner and central London estimated an uplift figure of 22% for changes in the mean journey time (Modelling journey time variability to assist in designing a journey time variability performance indicator for the transport for London Road Network, Jonathan Turner 2008). This supports the use of the upper end value of 20% for this study and is included as a reliability adjustment in the monetized costs and benefits.

The User Benefits are proportioned between consumer and business users for Vehicle Operating Cost and Travel Time Cost.

The QUADRO rates demonstrate much higher incidents of accidents within road works. The introduction of the Permit Scheme will bring about a proportionate reduction in road works, which will lead to accident cost savings.

Central Bedfordshire Permit Scheme Cost Benefit Analysis

Table 49 Central Bedfordshire Monetized Costs and Benefits

| Central Bedfordshire Sample Sites QUADRO Results Summary | | | |

6 PERMIT SCHEME OPERATION

6.1 Introduction

This section assesses the process tasks required to establish and operate the Central Bedfordshire Permit Scheme. It will consist of the following sections:

- Fees Matrix, presentation of anticipated Permit applications by type
- Scheme Costs, presentation of staff costs associated with the level of Permit variations

6.2 Fees Matrix

The fees matrix is a DfT prescribed format for presenting the volume and type of Permit applications and anticipated variations. The estimated number of Permits by type was provided by Central Bedfordshire Council and is shown on Table 50 below. The Fees Matrix is attached in Appendix C.

Table 50 Utility Permit Volume before Scheme opening

| Central Bedfordshire Notice Volumes | | | | | | |
|-------------------------------------|--------|-----|--------|-----|--------------|-----|
| Work Type | RC 0-2 | | RC 3-4 | | Total Volume | |
| | Number | % | Number | % | Number | % |
| Major | 34 | 2% | 152 | 3% | 186 | 3% |
| Standard | 277 | 15% | 964 | 17% | 1,241 | 17% |
| Minor with Exc | 984 | 55% | 2,891 | 52% | 3,875 | 52% |

| Special Urgent | - | 0% | - | 0% | - | 0% |
| Emergency | 108 | 6% | 302 | 5% | 410 | 6% |
| Totals | 1,792 | 24% | 5,593 | 76% | 7,385 | |

The Utility Permit volumes by road categories are shown in Table 51 and Table 52 and with costings based upon statutory fee rates outlined in Table 8.

Central Bedfordshire Permit Scheme Cost Benefit Analysis

Table 51 Permit Volume on Category 0-2 roads

| Total Permit Scheme Cost | | | | | |
|-----------------------------------|--------------------------|-----------------|------------------------------------|---------------------------|------------------------------|
| Activity Type | Estimated No. of Permits | Cost per Permit | Estimated No. of Permit Variations | Cost per Permit Variation | Total Cost per Activity Type |
| Provisional Advance Authorisation | 41 | 124 | N/A | N/A | 5,084 |
| Major | 47 | 231 | 10 | 45 | 11,307 |
| Standard | 338 | 147 | 34 | 45 | 51,216 |
| Minor | 1,128 | 81 | 57 | 45 | 93,933 |
| Immediate | 466 | 61 | 24 | 45 | 29,506 |
| Sub Total | 2,020 | N/A | 125 | 45 | 191,046 |

Table 52 Permit Volume on Category 3-4 roads

| Category 3-4 Non-Traffic Sensitive Streets | | | | | |
|--|--------------------------|-----------------|------------------------------------|---------------------------|------------------------------|
| Activity Type | Estimated No. of Permits | Cost per Permit | Estimated No. of Permit Variations | Cost per Permit Variation | Total Cost per Activity Type |
| Provisional Advance Authorisation | 182 | 93 | N/A | N/A | 16,914 |
| Major | 160 | 158 | 32 | 35 | 26,267 |
| Standard | 998 | 65 | 100 | 35 | 68,882 |
| Minor | 3,090 | 32 | 155 | 35 | 105,265 |
| Immediate | 1,600 | 39 | 80 | 35 | 65,435 |
| Sub Total | 6,030 | N/A | 366 | 35 | 282,763 |

Permit fees are excluded from Public Accounts reporting in line with the DfT guidance. The volume of Utility Permit by road type will fall by 5% across all road types.

6.3 Scheme Costs

There are two elements to the Permit Scheme costs:

- Start-up costs; and
- Ongoing costs.

6.3.1 Start-up costs

The one-off costs required to establish the Permit Scheme were set at £85,000 by Central Bedfordshire Council. See Table 53 below.

Table 53 Scheme set up costs

| Scheme Set-up Costs | | |
|--|-------------------------------------|-----------------|
| Start up Cost Centre | Set-up (recovered from future fees) | Year 1 + |
| Consultancy | £45,000 | |
| KPI Production | | £30,000 |
| Permit Scheme Invoicing | | £35,000 |
| IT system/support & Capital Expenditure Adjustment | £15,000 | £5,000 |
| Unauthorised / Abandoned works | | £30,000 |
| Management Overhead | | £20,000 |
| Training | £15,000 | £10,000 |
| Staff | £10,000 | |
| Set-up costs recovery (3 years) | | £28,000 |
| Totals | £85,000 | £158,000 |

The 'IT Capital expenditure adjustment' is a provision calculated by applying the 'risk bias factor' outlined in section 4.4 to the purchase of the IT system. The operational policy outlined in Table 9 that proposed that no costs associated with the implementation of the Scheme will be carried on to future years and that that all set up costs are incurred in the month before the Permit Scheme becomes operational.

1.1.1 Operational costs

The Permit Scheme required three specific job roles:

- Street Works Officers;
- Street Works Co-ordinators; and
- Traffic Managers.

The overall staffing costs of Permit Scheme operation are based on information from Central Bedfordshire Council and statutory rates and are outlined in Table 54.

Table 54 Staff Costing

| Staff Costing | | | |
|---------------------------|---------------|-------------------|-------------------|
| Personnel Type | Annual Salary | Final Hourly Rate | Total Annual Cost |
| Street Works Officer | £ 24,931 | £ 25.55 | £ 42,931.18 |
| Street Works Co-ordinator | £ 34,050 | £ 34.90 | £ 58,634.10 |
| Traffic Manager | £ 43,852 | £ 44.95 | £ 75,513.14 |

| | |
|------------------------------|------|
| National Insurance (%) | 9 |
| Pension (superannuation) (%) | 14 |
| Working hours/annum | 1680 |
| Employee Overhead Rate | 1.4 |

Central Bedfordshire Permit Scheme Cost Benefit Analysis

The breakdown of costing per task for each of the three grades of Permit Scheme workers is shown in Table 55 below.

Table 55 Breakdown of Employer Costing per Permit Task

| Employee Costing per Permit Task | | | | | | |
|--|--------|--------|----------|---------|-----------|---------|
| Category 0-2 and Traffic Sensitive Streets | | | | | | |

7 FINANCIAL CALCULATIONS

7.1 Introduction

This section will present the calculation of financial benefits for the statutory outputs:

- Public Accounts - Local Government Funding
- Public Accounts - Central Government Funding
- Transport Economic Efficiency
- Monetized Costs and Benefits

The calculations will be presented for the opening year and for the 25-year Scheme horizon, and will be discounted where required.

7.2 Public Accounts - Local Government Funding

The Local Government public account reporting has the following categories:

- Revenue
- For the purposes of this Cost Benefit Analysis, the Permit fee income is calculated by the multiplication of the estimated Permit fee volume and the average Permit fee, which is derived using the maximum permit fee structure as shown on Table 8. The full cost of the Scheme in the opening year is comprised of the set up costs and the Scheme operating costs summarized in Tables 58 and 64. The average cost-recovery price of Permits is generated by dividing the total cost in the opening year by the estimated number of Permit volumes at the start of the year. The number of Permits in the opening month is a monthly pro-rata value based upon the estimated number of Permits in the opening year along with the 20% uplift for phased works. The Permit Scheme is scheduled to become fully operational in the opening month of the opening year of the assessment and from the second and subsequent months, the 5% reduction in Permit volume will come into effect.
- Operating costs
- Investment costs
- Developer and other contributions
- Grant / subsidy payments

7.2.1 Revenue

For the purposes of this Cost Benefit Analysis, the Permit fee income is calculated by the multiplication of the estimated Permit fee volume and the average Permit fee, which is derived using the maximum permit fee structure as shown on Table 8. The full cost of the Scheme in the opening year is comprised of the set up costs and the Scheme operating costs summarized in Tables 58 and 64. The average cost-recovery price of Permits is generated by dividing the total cost in the opening year by the estimated number of Permit volumes at the start of the year. The number of Permits in the opening month is a monthly pro-rata value based upon the estimated number of Permits in the opening year along with the 20% uplift for phased works. The Permit Scheme is scheduled to become fully operational in the opening month of the opening year of the assessment and from the second and subsequent months, the 5% reduction in Permit volume will come into effect.

7.2.2 Operating costs

The operating costs for the Scheme are comprised of:

- Staff and operation costs;
- Asset maintenance costs; and

- Unrecoverable fees

No provision has been made for on-going asset maintenance of the Permit Scheme.

The Operational Costs of £39,167 in the first month are a pro-rata apportionment of the opening year total of £465,993 contained within Tables 58 and 64.

It has been assumed (Table 7 Model Variable specification) that half of the percentage reduction in Permit volume would be applied to the Scheme costs giving a 2.5% reduction. The full reduction is applied for costs starting in the second year, with a pro-rata increase throughout the opening year.

Non recoverable costs for Highway permits for the Council's on schemes has been included as an administration charge and is carried out by a Highway Administrative Officer based on approximately 5 minute extra administrative time for each work requiring a permit:

Salary - £18,500 per annum and 1,628 hours worked per year.

With pensions and overheads etc this equates to £22 per hour.

$\text{£}22 / 60\text{mins} \times 5\text{mins} = \text{£}1.83$ of cost per Permit Application.

Financial calculations for year 2 to 25 are shown on Table 60 to 63 (5% saving) and 66 to 69 (10% saving).

7.2.3 Investment costs

The investment costs of £85,000 are incurred in the month before the Permit Scheme opening and recovered throughout the opening year through Permit Scheme income. The detailed breakdown of costs is presented in Table 53.

7.2.4 Developer and other contributions

There are no developer or other contributions in the Local Government Public accounts reporting.

7.2.5 Grant / subsidy payments

There are no grant or subsidy payments in the Local Government Public accounts reporting.

7.3 Public Accounts - Central Government Funding

The Central Government public account reporting has the following categories:

- Revenue
- Operating costs
- Investment costs
- Developer and other contributions
- Grant / subsidy payments
- Indirect tax revenues

7.3.1 Revenue

There is no revenue in the Central Government Public accounts reporting.

7.3.2 Operating costs

There are no operating costs in the Central Government Public accounts reporting.

7.3.3 Investment costs

There are no investment costs in the Central Government Public accounts reporting.

7.3.4 Developer and other contributions

There are no developer or other contributions in the Central Government Public accounts reporting.

7.3.5 Grant / subsidy payments

There are no developer or other contributions in the Central Government Public accounts reporting.

7.3.6 Indirect tax revenues

The indirect tax revenue calculation is based upon the loss of fuel taxation revenues to Central Government from the more efficient functioning of the highway network from the reduction in road works.

7.4 Transport Economic Efficiency

The Transport Economic Efficiency (TEE) table reports on user benefits by consumer and business sections for time, fuel and non-fuel vehicle operating impacts.

7.4.1 Consumer User Benefits

The consumer user benefit consists of private car and bus travel time, and vehicle operating costs.

7.4.2 Business User Benefits

The business user benefits are for commercial car travel and private sector providers for Travel time and vehicle operating costs.

8 STATUTORY OUTPUTS

8.1 Introduction

This section presents the statutory outputs required for the Central Bedfordshire Permit Scheme Cost Benefit Analysis.

The results are presented in the opening year and over the 25-year horizon in 2010 prices as advised in WebTAG.

The discounted totals are presented at the bottom of each table. The calculation basis of each category has been presented in Sections 5, 6 and 7.

The statutory outputs consist of three categories:

8.2 Transport Economic Efficiency (TEE)

The TEE table presents the net user benefits of travel time, fuel and non-fuel vehicle operating costs disaggregated by trip purpose between non-business consumers and business users, including transport operators and are below on Tables 70 to 73.

8.3 Public Accounts

The Public Accounts tables show the net impact to Local and Central Government and are below on Tables 74 to 77.

8.4 Cost Benefit Analysis

The items for inclusion in the central case Cost Benefit Analysis BCR and NPV are based upon the guidance specified in Annex C of TMA 2004 Decision-making and development (2nd edition) which specifies:

- Permit Fees are excluded from the Public Accounts table;
- Indirect Taxation is excluded from the Public Accounts table; and
- Permit Fees are not treated as a dis-benefit to business.

Revenue received from Permit Fees has been assumed to be reinvested in the authority and therefore offset in the economic appraisal as a capital cost.

Tables 78 to 81 are below.

8.5 Statutory Cost Benefit Analysis

The study has addressed all aspects of the implementation of the Central Bedfordshire Permit Scheme through both the direct financial and socio-economic criteria to quantify the overall economic merit of the Scheme.

The Scheme has a Benefit Cost Ratio of and Net Present Value of in current prices (2010 prices). The appraisal results demonstrate that the introduction of the Permit Scheme will have a net positive economic benefit.

9 CENTRAL BEDFORDSHIRE PERMIT SCHEME COST BENEFIT ANALYSIS RESULTS

9.1 Introduction

This section will summarises the findings of the Central Bedfordshire Permit Scheme Cost Benefit Analysis and consider the impact on the Highway Authority.

9.2 Central Bedfordshire Highway Authority Cost Benefit Analysis

In addition to the statutory results presentation, an additional BCR and NPV is presented from the perspective of the Highways Authority (Table 82), which includes the cost recovery from Permit Fee income and includes the effect of indirect taxation. The summary of benefits is presented in Table 83.

Table 82 Highway Authority Central Bedfordshire Cost Benefit results

| Highway Authority Assessment | Opening Year | 25 Year |
|--------------------------------------|--------------|--------------|
| 5% reduction in works impact | | |
| Net Present Value of Benefits | £4,315,532 | £107,888,294 |
| Net Present Value of Costs | £492,611 | £10,338,728 |
| Net Present Value of Permit Scheme | £3,822,921 | £97,549,567 |
| Benefit to Cost Ratio | 8.76 | 10.44 |
| | | |
| Highway Authority Assessment | Opening Year | 25 Year |
| 10% reduction in works impact | | |
| Net Present Value of Benefits | £8,521,057 | £210,884,072 |
| Net Present Value of Costs | £474,977 | £9,774,222 |
| Net Present Value of Permit Scheme | £8,046,079 | £201,109,851 |
| Benefit to Cost Ratio | 17.94 | 21.58 |

The Scheme has a Benefit Cost Ratio of 10.44 and Net Present Value of £97.5m 2010 prices at 5% reduction in works which suggests the Central Bedfordshire Permit Scheme would be both viable and beneficial for the Highway Authority and the population of Central Bedfordshire.

The higher BCR and NPV are attributable to the net benefit of adding Permit Fee income and indirect taxation to the assessment and the difference in opening year and overall assessment BCR is due to the changing relationship of costs and benefits over the assessment period.

The projected discounted benefits in the opening year of £4.3m includes a reliability adjustment of 20% and has been assessed at a local level that has increased the estimated suggested benefit in the DfT report in Section 3.7. This is also influenced by high number of single carriageway roads that are subject to shuttle working creating higher delays.

9.3 Sensitivity Analysis

A series of sensitivity tests have been performed on the 25-year appraisal to further understand the economic performance of the Scheme and its effects at different policy levels. The Highway Authority central case assumption of a 5% reduction in works activity produced a BCR of 10.44.

The results in Table 84 below shows the standard sensitivity test of the level of works reduction required to produce a BCR of 2.0 and a BCR of 1.0.

Table 84 Standard Sensitivity

| Standard Sensitivity | | |
|----------------------|-------|-------|
| BCR | 1% | 2% |
| Works Reduction | 0.48% | 0.97% |

Table 85 below presents the BCR achieved based upon the level of works reduction achieved.

Table 85 Works Reduction Sensitivity

| Works Reduction Sensitivity | |
|-----------------------------|-------|
| Works Reduction | BCR |
| 1% Saving | 2.07 |
| 2% Saving | 4.15 |
| 3% Saving | 6.26 |
| 4% Saving | 8.39 |
| 5% Saving | 10.54 |
| 6% Saving | 12.71 |
| 7% Saving | 14.91 |
| 8% Saving | 17.12 |
| 9% Saving | 19.37 |
| 10% Saving | 21.63 |

Table 86 shows the level of roadwork reduction achieved at different BCR levels.

Table 86 BCR Sensitivity

| BCR Sensitivity | |
|-----------------|-----------------|
| BCR | Works Reduction |
| 1 | 0.48% |
| 2 | 0.97% |
| 3 | 1.45% |
| 4 | 1.93% |
| 5 | 2.41% |
| 6 | 2.88% |
| 7 | 3.35% |
| 8 | 3.82% |
| 9 | 4.29% |
| 10 | 4.75% |
